New and proven methods for petroleum and chlorinated solvent waste remediation

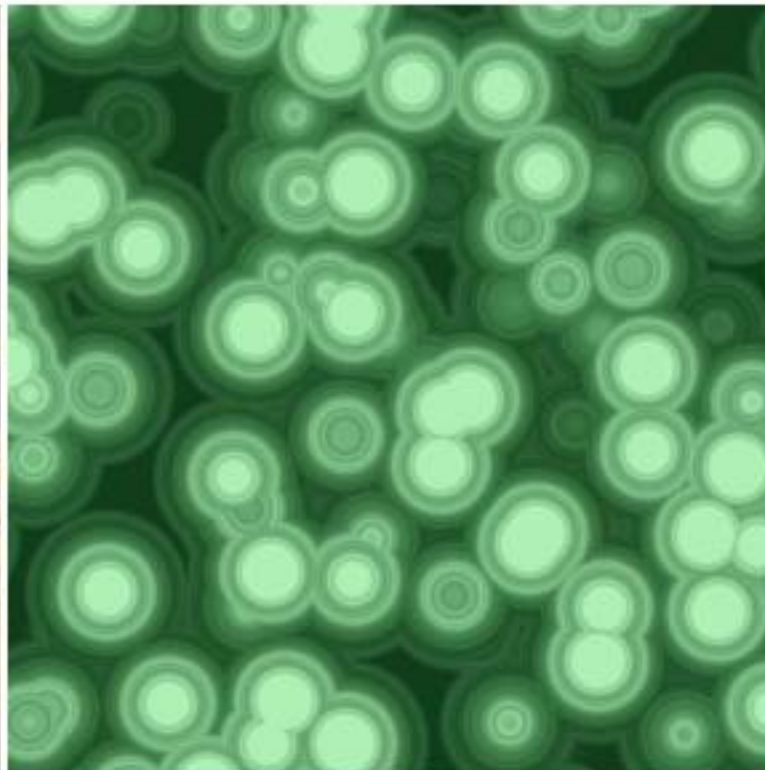

Our patented Subsurface Metabolic Enhancement system allows us to clean soil contaminants at levels that exceed government standards with a speed unmatched by our competitors

WHAT MAKES US DIFFERENT?

Our proprietary Subsurface Metabolic Enhancement (SME) system cultivates native organisms that consume hydrocarbon contamination, converting the pollutants into non-toxic water and carbon dioxide. Our organic SME method utilizes microorganisms found naturally in the soil and does not require harmful chemicals.

The SME system is easy to install and allows business owners to continue normal operations throughout the installation and remediation process.

SME technology has been used as an approved remediation method

in Utah and Idaho and is currently being introduced in other states and countries.

Our technology is effective, in fact Brigham Young University has awarded Pure Enviro Management an exclusive right to their microorganism which works most effectively with our SME cleaning method.

At Pure Enviro Management we:

- Organically clean the environment
- Bring value back to distressed properties
- Keep business running throughout the remediation process

'As a company our goal is to return soils back to their native habitat through proven and natural methods, while allowing business owners to continue building their business.' -Gabe Reid, Managing Partner
